BurgerCities (BURGER) Price Forecast in 2022

Since the [decentralized finance](#) (DeFi) market crashed, the value of the BurgerCities [cryptocurrency](#) has fallen significantly from its all-time high. From July 10 though, the price of a BURGER has increased by over 53%, and it has increased by almost 504% since the beginning of the month.

The BurgerCities development team just announced on July 7 that they have integrated iZUMi liquidity into the platform, allowing token swaps to take place instantly at more affordable rates.

□ [@Burger_cities](#) Integrates liquidity from [@iZumi_Finance](#)

□ Tokens can be swapped immediately at highly competitive rates — and all without compromising on user experience, as deep liquidity is aggregated through a plethora of DEX protocols.

Do you want to know **the Burger Swap Price Forecast in 2022**? In this article, we take a look at the BurgerCities protocol and the current price estimate from market analysts to see if the recent price surge can be sustained in the long run.

BurgerCities(BURGER): Explained

To compete with SushiSwap on [Ethereum](#), BurgerSwap debuted in September 2020 as a “democratized AMM” or automated market maker on the Binance Smart Chain. Recently, the anonymous community development team has moved its attention to developing a playable metaverse game that incorporates DeFi.

MetaFi is quickly becoming the standard term for “DeFi” in the [metaverse](#). BurgerSwap’s decentralized marketplace features are now built into BurgerCities. In the BurgerCities game, players can take on the role of liquidity providers by selecting a specific token pool.

In December of 2021, BurgerCities released an update to BurgerSwap, which included the protocol for aggregating orders. Users can “engage in daily activities like socializing, gaming, and so on in this realm,” as stated on the project’s blog, while also “experience[ing] DeFi and [NFT](#) functions such as Swap, Staking, and viewing NFT exhibitions through their visual metaverse image.” This is all made possible thanks to the integration of non-fungible tokens (NFTs) into the metaverse environment.

In an effort to enhance the utility and entertainment value of the BurgerCities platform, the developers have integrated a game in which players explore the metaverse with BurgerCities NFT heroes equipped to deal with monsters, PK, land management, PVP, and more.

For incentives while the project changes its brand and functionality, “to fast grasp the MetaFi market and achieve rapid traffic development,” the project’s developers released extra tokens in June, beyond the original 21 million put into circulation, causing considerable criticism.

However, BurgerCities decided to issue tokens first and then announce it to our community because of a mismatch between the development of the product and the date of token issuance. This strategy lacks forethought and disregards our community’s sentiments. BurgerCities has burned all the extra tokens so that the benefits for the current token holders are not diminished. There are once again 21 million tokens in circulation.

BurgerCities has a market capitalization of \$53m as of 12 July, placing it at the 346th largest cryptocurrency by value, with 20.6 million tokens in circulation out of a total of 21 million, and a price of \$2.59 at the time of writing.
