## What is the Omni Network?

The biggest existential threat to Ethereum is fragmentation caused by Rollup. As Rollup continues to grow in popularity, Ethereum's users and their capital are increasingly dispersed into isolated ecosystems, reducing the global network effect. While Omni Network solves this problem by consolidating all Rollups into a cohesive, interoperable network.

Omni Network is Ethereum's integrated rollup and Layer 1 blockchain designed to enhance Ethereum cross-rollup interoperability. It allows developers to integrate the Omni network into their dApps without any changes to the code and send cross-rollup messages through the network. In short, the Omni Network combines the security of Ethereum with the flexibility and scalability of Cosmos.

The Omni Network's operating model can be considered as a Layer 1 platform, where the blockchain built on the Omni Network is the Rollup Chains. However, the Omni Network operates differently from Ethereum and current Layer 2 solutions. The main difference is that the Omni Network's target platform is built around cross-rollup applications.

Cross-rollup applications can easily interact with each other, process and transmit messages, thus creating synchronization and connectivity within the Omni Network ecosystem. This also means that cross-chain solutions are not required to transform assets within the cross-rollup application ecosystem.

Overall, the Omni Network aims to be the "Ethereum interoperability infrastructure," providing interoperability for Rollup networks such as Optimism, Arbitrum, zkSync, and Starkware to become the core infrastructure for all Rollup networks and modular applications on Ethereum, enabling a seamless and secure cross-Rollup user experience.

## How does Omni Network Work?

Omni Network will be operated by the Ethereum network's restakes, acting as a verifier to ensure security.

By using Tendermint's consensus mechanism and the flexibility of the Cosmos SDK, Omni Network validator can confirm the Rollup's status faster than Layer 1, making Omni a fast information transfer layer for other Rollup or Layer 1. Omni is EVM-compatible, allowing developers to build applications across multiple chains using Solidity and EVM, and Omni's execution layer is compatible with EVM supported by Evmos Ethermint.

The following sets forth the key features of Omni Network:

- **Benefits for Developers and Users:** the unified environment fostered by Omni Network unlocks a treasure trove of advantages for both developers and users:
- **Unified Applications:** developers can design dApps that operate seamlessly across the entire Ethereum rollup landscape, eliminating the need for separate versions for each rollup.
- **Upgraded Assets:** token issuers can enhance their tokens by granting them access to the global liquidity and application integrations available across all rollups.
- **Expanded Applications:** existing applications can expand their reach beyond a single rollup's user base and liquidity, without requiring code modifications.
- **Innovation for Developers:** Omni unlocks a new frontier for developers, empowering them to create a new generation of global applications that tap into the full potential of the Ethereum rollup ecosystem.
- **Seamless User Experience:** with gas abstraction, users no longer need to hold native tokens for each network they interact with. They can pay fees with a single token, simplifying cross-chain transactions.
