Web Chart Fully Upgraded: Enhanced Candlestick Analysis and Trading Experience

BTCC's web platform now integrates TradingView's advanced technical analysis tools, supporting drag-and-drop take profit and stop loss settings directly on charts, split-screen view for multiple charts, and the newly added FBB (Fibonacci Bollinger Bands) indicator. These comprehensive charting and technical analysis tools can help traders make significantly better trading decisions.

Drag-and-Drop TP/SL Setting

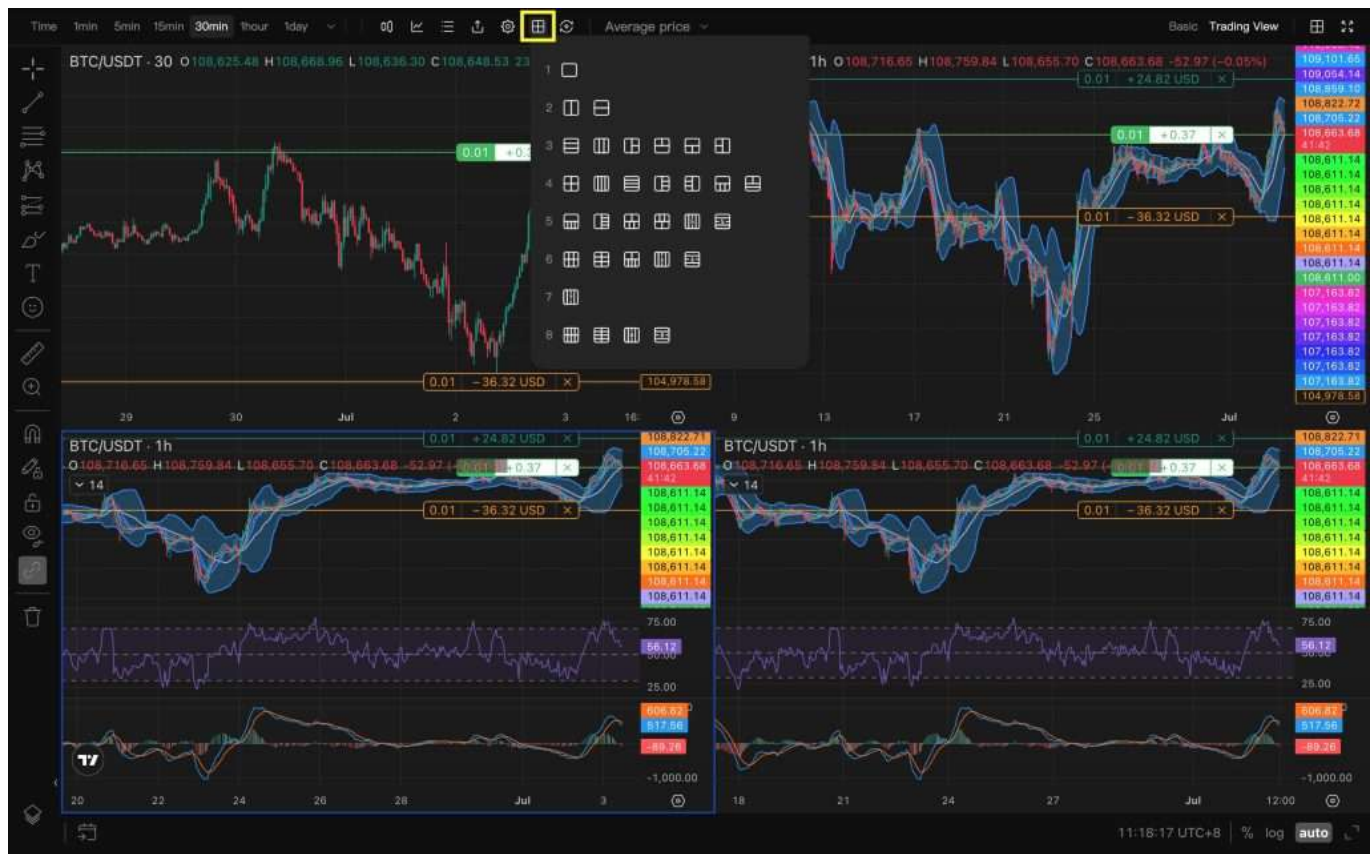

On the BTCC Web platform, users can set Take Profit (TP) and Stop Loss (SL) orders directly by dragging order lines on the chart. Simply drag the TP/SL controls up or down to the desired price level, and once confirmed, the system will automatically execute the order. To enhance convenience, the chart displays projected Profit and Loss (P&L) in real-time. Additionally, users can modify or cancel existing TP/SL settings at any time for flexible risk management.

Tip: The left side of the chart features multiple drawing tools to enhance your chart analysis. Simply click on each tool icon to access different tool options.

New Split-Screen Feature

The TradingView split-screen feature allows users to view and analyze multiple charts simultaneously on a single page. Users can create independent drawings on each chart to improve trading efficiency. Simply divide the screen into multiple areas, with each section displaying different trading pairs, timeframes, or indicators.

Tip: To switch between charts in a multi-chart layout, simply press the Tab key.

New Fibonacci Bollinger Bands (FBB) Indicator

The Fibonacci Bollinger Bands (FBB) indicator is a technical analysis tool that combines Fibonacci retracement levels (FMA) with Bollinger Bands (BOLL). It utilizes the volatility range of Bollinger Bands and Fibonacci ratios to identify potential support and resistance levels, allowing for a more precise grasp of price fluctuation ranges and forming a more refined trading zone to assist in trading decisions.

On the BTCC Web chart, users can search “FBB” to apply this indicator.

With the help of the FBB indicator, the following analyses are commonly performed:

- Identifying key support and resistance levels: The upper and lower bands of FBB often act as potential resistance and support levels, helping traders identify better entry and exit points.
- Assessing trend strength: Changes in the width of Bollinger Bands reflect market volatility. Narrowing of the bands usually indicates a consolidation phase, while expansion may signal a strengthening trend.
- Optimizing risk control and trading strategy: By incorporating Fibonacci ratios, traders can more precisely set SL and TP levels, thereby improving the stability and win rate of their trading systems.

It is important to note that any technical analysis tool has its limitations. Traders should combine its use with other indicators or market conditions for comprehensive judgment. Additionally, users can right-click on the chart to access settings and customize candlestick colors, creating a personalized trading interface. For more professional chart features, please visit the BTCC website.
